Lab Exercise 3 - Write a C program or shell script to send a simple mail to any host without using any professional mailer like gmail.

Code:

Install sendmail and run the following script

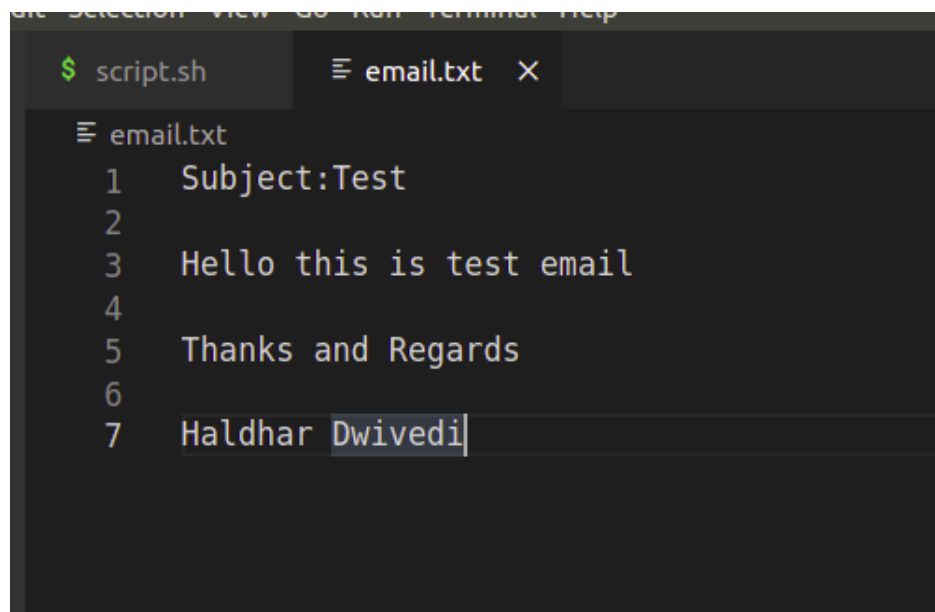

A terminal window with a dark background and three colored window control buttons (red, yellow, green) at the top left. The terminal contains a shell script with three lines of code.

```
#!/bin/bash

T0="mewibe1327@rippb.com"

sendmail $T0 < email.txt
```

Email.txt:

A screenshot of an email client interface. The top bar shows a menu with options like 'File', 'Selection', 'View', 'Go', 'Run', 'Terminal', and 'Help'. Below the menu, there are two tabs: 'script.sh' and 'email.txt'. The 'email.txt' tab is active, showing the content of the file. The content is a plain text email with a subject line, a body, and a signature.

```
$ script.sh  email.txt x
email.txt
1 Subject:Test
2
3 Hello this is test email
4
5 Thanks and Regards
